Intel® Fortran – Great Standards Supports

The compiler in Intel Fortran Composer XE 2013 offers great Fortran standards coverage, now with expanded support for Fortran 2003 and 2008 and full source code compatibility with Compaq Visual Fortran. On Windows and Linux, it includes support for coarray Fortran, providing support for multi-cpu shared-memory nodes. Cluster support is available in Intel® Cluster Studio XE product. The benefit is performance for your Fortran applications as they run on individual computers or clusters.

Intel® Fortran compiler supports Intel® Core® & Xeon® Processors and Intel® Xeon Phi™ Coprocessors
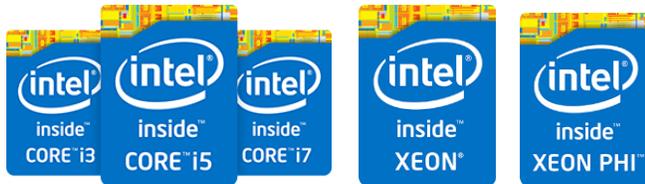

Intel Fortran supports Intel and compatible processors, including application offloading to Intel Xeon Phi coprocessors and the graphics processing units that are part of the Intel Core i3, i5 and i7 processors.

Vectorization, Parallelism Made Powerful

Intel Fortran, like Intel C++, includes support for three industry-leading vectorization and parallelism features associated with Intel Core Processors, Intel Xeon Processors and Intel Xeon Phi coprocessors.

First, the compiler automatically vectorizes and/or automatically parallelizes code for use on systems with Intel® Core™, Intel® Xeon, and compatible processors. These capabilities have been enhanced for broader applicability and improved application performance. And they support the wider vectors in the latest Intel Architecture processors.

Second, when a loop can't be vectorized, GAP – Guided Auto Parallelism can generate a report suggesting source code changes, use of pragmas, or use of compiler options. You remain in control in applying suggestions. In cases where you know your code well, GAP can offer great opportunities for performance improvement.

Third, Intel Fortran supports application development for Intel® Xeon Phi coprocessors using simple directives. Support is extended to Xeon Phi coprocessors hosted on Xeon-based systems using Linux and, new with SP1, Windows. The benefit? Choose your operating environment, maintain your existing programming model, and use of Fortran, to take advantage of outstanding application performance.

Intel® MKL – Optimization Made Even Easier

One of the easiest ways to take advantage of vectorization and threading is to make calls in your applications to the pre-optimized functions in the Intel® MKL. A wealth of routines is included to optimize math-intensive application performance. Applications using Intel® MKL functions automatically scale on previous, current and future processor architectures. Just re-link to the latest library version and your code is ready to take advantage of the latest processor features available.

Intel® MKL offers the highest-performing implementations of LAPaCK and BLAS linear algebra functions and are 100% compatible with these de facto industry standard APIs. Fast Fourier Transforms functions include FFTW*-compatible APIs to ease adoption. Additional routines include vectorized transcendental functions, random number generators for several probability distributions, convolution and correlation routines, and summary statistics functions.

The Rogue Wave* IMSL* Numerical Library for Intel Visual Fortran (Windows only) is also available. This leading library offers the largest collection of commercially-available math and statistical functions for science, technical, and business environments.

Take Comfort – Intel Fortran Composer XE is compatible with the way you work

Intel Visual Fortran Composer XE for Windows integrates into Microsoft Visual Studio* 2008, 2010 and 2012. For those who do not have Visual Studio, it includes the Microsoft Visual Studio 2010 Shell so you have a choice of command-line or IDE-based development. Intel Fortran Composer XE supports the gnu tool chain on leading Linux distributions and Mac OS X. Intel Visual Fortran Composer XE (Windows) and Intel Fortran Composer XE (Linux, OS X) supports all IA-32 and Intel 64 architectures, including the Intel Xeon Phi coprocessor, and includes one year of support. In addition, there's an active community of developers out there sharing their experiences on our Forums.

Take Advantage – Intel Fortran Composer XE supports standards and delivers application performance

Intel Fortran Composer XE 2011 supports performance-oriented industry standards, adding more support for Fortran 2003, Fortran 2008, and OpenMP* 4.0. Coarray support is provided for shared-memory systems and for large-scale compute-clusters with the Intel Fortran included in Intel® Cluster Studio XE 2013. Other Fortran 2008 features include CONTIGUOUS, I/O enhancements, and intrinsic functions, a set of which includes matrix multiply intrinsic functions that support calls into Intel MKL. Fortran 2003 support has also been enhanced, providing complete type-bound procedures such as GENERIC and OPERATOR. Support for Fortran 2003 features such as object-orientation, type-bound procedures and operators, and C++ interoperability continue to make it easier to develop mixed-language applications. Intel Fortran interacts nicely with new C99, C++ 03, and C++11 features that are supported in Intel® C++.

Intel continues to enhance proven compiler features such as the High-Performance Parallel Optimizer (HPO).   This powerful capability combines vectorization, parallelization, and loop transformations in a single pass that is faster, more effective, and more reliable than individual, discrete phases.   Intel Fortran also automatically vectorizes code for use on systems with conventional Intel® Xeon, Intel® Core, and compatible processors, and includes vectorization tools for applications targeting Intel Xeon Phi coprocessors. When the compiler can't vectorize for use on Intel Xeon and Intel Core processors, you can use Guided Auto-Parallelization (GAP) to get a report suggesting changes so your code will vectorize.   Interprocedural optimization and profile-guided optimization continue to provide developers with opportunities to enhance performance by in-lining code and restructuring code based on workload, respectively. Performance is #1 at Intel.

Take it Easy – Intel Math Kernel Library keeps you productive and delivers application performance

With Intel Math Kernel Library, Intel Fortran Composer XE is a lot more than a compiler. It's a library of highly optimized, extensively threaded math routines, including BLAS, LAPACK, ScaLAPACK, sparse solvers, fast Fourier transforms vector math and much more.   This library is designed to take full advantage of the wider vector units and growing number of cores on modern processors to deliver maximum scalable performance. Intel Fortran Composer XE ships with lots of sample code and tutorials to simplify development with examples and snippets.
